

Do the COVID-19 vaccines **protect me from the Delta variant?**

Yes.

- The vaccines keep people out of the hospital and out of ICUs. They prevent deaths from all known variants of COVID-19.
- The Delta variant is very contagious, and it is mostly being spread among people who are unvaccinated. In fact, 98 percent of deaths in the United States from COVID-19 are in unvaccinated people.
- **Getting vaccinated is the best way to help end the pandemic, and protect yourself, your loved ones, and your co-workers.**
