Clinical Management of Critically Ill Adults with COVID-19

Clinician Outreach and Communication Activity (COCA) Webinar

Thursday, April 2, 2020
Continuing Education

Continuing Education is not offered for this COCA Call.
To Ask a Question

- Using the Webinar System
  - Click the Q&A button.
  - Type your question in the Q&A box.
  - Submit your question.

- If we are unable to get to your question during the call, you may also email your question to coca@cdc.gov.

- For media questions, please contact CDC Media Relations at 404-639-3286, or send an email to media@cdc.gov.
For More Clinical Care Information on COVID-19

- Call COVID-19 Clinical Call Center at 770-488-7100 (24 hours/day).
- Refer patients to state and local health departments for COVID-19 testing and test results.
  – Clinicians should NOT refer patients to CDC to find out where or how to get tested for COVID-19, OR to get COVID-19 test results.
- Visit CDC’s Coronavirus (COVID-19) website: https://www.cdc.gov/coronavirus
- Visit emergency.cdc.gov/coca over the next several days to learn about future COCA Calls.
Today’s Presenters

- **CAPT Tim Uyeki, MD**  
  Clinical Team Lead  
  COVID-19 Response  
  Centers for Disease Control and Prevention

- **Michael Bundesmann, MD, FCCP**  
  Medical Director of Respiratory Therapy  
  Pulmonary and Critical Care Medicine  
  EvergreenHealth  
  Kirkland, WA

- **Waleed Alhazzani, MD, MSc, FRCPC**  
  Associate Professor Department of Medicine,  
  McMaster University  
  Hamilton, Ontario, Canada
COVID-19 Overview for Clinicians

<tr>
<td><strong>Critical Illness</strong></td>
<td>Respiratory failure, septic shock, multiple organ dysfunction/failure</td>
</tr>
</tbody>
</table>

Link: [WHO Guidelines 2020](https://www.who.int/docs/default-source/coronaviruse/technical-guidance/coronavirus-disease-covid-19)
Most patients had mild to moderate disease, but nearly 20% had severe or critical illness

COVID-19 - China through 11-Feb-2020 (N=44,415)

Of 1,099 hospitalized COVID-19 patients (through 29-Jan-2020) 5% were admitted to the ICU (Guan et al. NEJM 2020)

Links: Wu JAMA 2020
Potential for patients to have acute deterioration in the second week of illness

COVID-19 - China through 2-Jan-2020 (N = 41)

Link: Huang Lancet 2020
But the case-fatality is disproportionately higher among older adults

COVID-19 - United States, February 12–March 16, 2020 (N = 4,226)

Links: MMWR 2020
Older adults: More likely to require ICU care and die, but hospitalizations and ICU admissions also occur among non-elderly adults

COVID-19 United States, February 12–March 16, 2020 (N = 4,226)
Mortality from COVID-19 is highest among persons with underlying medical conditions

COVID-19 - China through 11-Feb-2020

- Cardiovascular Disease: 10.5%
- Diabetes: 7.3%
- Chronic Respiratory Disease: 6.0%
- Cancer: 5.6%

Link: China COVID-19 Epi Team 2020
Most, but not all patients have fever, cough, or shortness of breath on hospital admission (China, Singapore, U.S.)

- Fever:
  - Two US ICU cohorts: 50-52% had fever at admission

- Cough:

- Dyspnea:

Lower respiratory specimens may have higher virus yield than upper respiratory specimens, China (N = 205) Jan 1-Feb 17 2020

Abbreviation: ND, no data.

Link: Wang JAMA 2020
Laboratory findings at hospital admission

- **Lymphopenia** (83%)
- Thrombocytopenia (36%)
- Leukopenia (34%)
- C-reactive protein $\geq 10$ mg/L: (61%)
- Elevated AST, ALT: (20-39%) - higher with severe disease
- Procalcitonin - typically normal on admission

- **Co-infections:**
  - Sporadic viral co-infections reported (e.g., influenza, parainfluenza)
  - Community-acquired secondary bacterial infection not reported in published case series (blood cultures: negative)

Laboratory abnormalities in severe disease

- Associated with severe or critical illness:
  - ↓ lymphocytes, ↑ neutrophils
  - ↑ alanine aminotransferase and ↑ aspartate aminotransferase levels
  - ↑ lactate dehydrogenase, ↑ PCT, ↑ CRP, ↑ ferritin levels
  - ↑ serum levels of pro-inflammatory cytokines and chemokines
  - Evidence of immune dysregulation: Higher plasma levels of pro-inflammatory cytokines (TNFα, IL-1, IL-6) and chemokines (IL-8) in severe/critically ill patients vs less severely ill patients

- Associated with mortality: ↑ D-dimers and lymphopenia

Leukocytosis, specifically neutrophilia, during hospitalization is associated with death (N = 138, China, Jan 1-28, 2020)

Link: Wang JAMA 2020
Lymphopenia is common in all patients, but may be lower in non survivors than survivors (N = 138, China, Jan 1-28, 2020)

Link: Wang JAMA 2020
D-dimer is a strong predictor of death when compared with other markers of COVID-19 severity (N = 191), China, Dec 28, 2019 - Jan 28, 2020

Adult ICU Case Series, U.S.
(N = 21) Feb 20-March 5, 2020; (N=24) Feb 24-March 9, 2020

- Common co-morbidities
  - Heart failure (0-43%)
  - COPD (4-33%)
  - Diabetes (33-58%)
  - Kidney disease (21-48%)
  - Obstructive sleep apnea (21-29%)

- Onset to ICU admission: @4.5-7 days

- Mean age: 70 years (43-92); 63 years (23-97)

- Complications
  - Respiratory failure requiring mechanical ventilation: (71-75%)
  - Shock requiring vasopressors: (67-71%)
  - Acute kidney failure: (0-19%)
  - Cardiomyopathy: (0-33%)
  - Bacterial co-infection (1/21; 0/20)

- Mortality: (50-52%)

Arentz JAMA 2020; Bhatraju NEJM 2020
COVID-19: Inpatient clinical management

- No proven FDA-approved treatment for COVID-19

- Management is supportive
  - Hypoxemic respiratory failure/ARDS
  - Septic shock
  - Cardiomyopathy/arrhythmia
  - Common critical care complications

COVID-19: Therapeutics

- No FDA-approved specific treatment for COVID-19 patients

- Corticosteroids **should be avoided** unless indicated for other reasons
  - May prolong viral replication
  - Data supporting use is uncontrolled and not high quality

- Several drugs under investigation:
  - Remdesivir
  - Hydroxychloroquine or chloroquine
  - Lopinavir/ritonavir
  - IL-6 blockers (e.g., tocilizumab, sarilumab)

**Clinical management of severe acute respiratory infection (SARI) when COVID-19 disease is suspected**

Interim guidance
13 March 2020

This is the second edition (version 1.2) of this document, which was originally adapted from Clinical management of severe acute respiratory infection when MERS-CoV infection is suspected (WHO, 2019).

It is intended for clinicians involved in the care of adult, pregnant, and paediatric patients with or at risk for severe acute respiratory infection (SARI) when infection with the COVID-19 virus is suspected. Considerations for paediatric patients and pregnant women are highlighted throughout the text. It is not meant to replace clinical judgment or specialist consultation but rather to strengthen clinical management of these patients and to provide up-to-date guidance. Best practices for infection prevention and control (IPC), triage and optimized supportive care are included.

Case 1

47-year-old man with 7 days of URI, 3 days of worsening dyspnea

- HTN, obesity (BMI 36), untreated DM
- No tobacco
- Home medications included lisinopril, HCTZ, carvedilol
- At time of presentation, he was not tested for COVID-19
Hospital Course

- Intubation and institution of lung protective ventilation from day 2 through day 14
- Proned days 2-13 of hospitalization
  - Inhaled epoprostenol and NMB were not given
  - Extubated to HFNC
- Ceftriaxone and azithromycin discontinued after 7 days (no initial procalcitonin checked)
- On day 6, compassionate use Remdesivir was given for 10-day course
- On day 10, hydroxychloroquine 400 BID, then daily x 5 days
- On day 21, weaned to room air, significant neuromuscular weakness
Notable Findings

- 3/2 Respiratory pathogen panel negative
- 3/2 NP sample drawn, SARS-CoV-2 detected 3/6
- 3/2 Bronchoscopy BAL 62% Ly, 13% PMN
- Abs lymphocyte $1.0 \times 10^3$/uL
- AST/ALT < 2x ULN
- CRP 15.93 on 3/8 decreased to 1.11
- Normal NT-proBNP, TnI
- Normal echocardiogram, except for mild pulmonary HTN
Lab Trends

- **CPK**
  - Generalized Normal High
  - Generalized Normal Low

- **C Reactive Prot**

- **Lymph # Auto**
  - Generalized Normal High
  - Generalized Normal Low

- **POC P/F Ratio**
Hospital course

- Significant weakness and myopathy
  - No steroids or NMB were used

- Remains hospitalized more than four weeks after admission
  - Complicated below DVT, then psoas hematoma on anticoagulation

- COVID-19 testing remained positive after 3 weeks

- Repeat COVID-19 testing negative during 4th week
Case 2

73-year-old man with controlled asthma, HL, BPH. Good functional capacity and active.

- 4 days prior to admit was seen in urgent care for 7 days of cough, fever, fatigue
- 2/27 – presents to ED with SpO2 82%. Placed on HFNC, intubated within 24 hrs
- At the time of admission, RF for COVID-19 were not identified.
- COVID-19 testing was positive in 2/29
4 days prior to admission

Day of admission
Hospital Course

- Cefepime, Vancomycin
- Paralyzed, prone x 4 days
- Day 7 compassionate use remdesivir was added
- Weaned off vasopressors by day 7
- Day 11 worsening acute kidney injury
- Day 11 worsening shock and LVEF (normal troponin)
- CRRT started day 14
- Comatose on day 24, failing SBT, remains on HD. MRI brain, CT brain and LP negative
- Acutely deteriorated further, goals changed to comfort-care and patient expired
Lab Trends
Bronchoscopy & Laboratory Results

- Day 1 Bronchoscopy with lavage - 32% Ly, 34% PMN
- Procalcitonin 0.97
- Day 9 Bronch due to suspected VAP – negative cultures. PMN 63%
Echocardiogram Results

- Day 1 – normal transthoracic echocardiogram
- Day 4 – limited TTE remains normal
- Day 9 – LVEF 30% with global dysfunction
Evergreen ICU Summary

- >45 ICU admits
- >30 Required mechanical ventilation
- 4 Transferred for ECMO (3 were ultimately cannulated)
- 7 extubations (ages 44-84)
  - Includes 44 year old transfer for ECMO and RRT
- Duration of MV in extubated patients has been 5-13 days
- 4 required renal replacement therapy
Approach to care

- Early intubation
- Early use of proning, lung protective ventilation
- Light sedation, early PT
- Avoidance of corticosteroids, unless clear indication
- Enrollment in clinical trial for therapeutics
- Fluid restrictive approach
- Early discontinuation of antibiotics if low procalcitonin, negative cultures
- Consider early consultation for ECMO in young and sickest patients

Infection Control

• For healthcare workers performing aerosol generating procedures on patients with COVID-19 in the ICU, we recommend using fitted respirator masks (N95 respirators, FFP2, or equivalent), as compared to surgical/medical masks, in addition to other personal protective equipment.

*FFP3 respirators are more commonly used in many parts of the world.
Infection Control

1. Usual care for non-ventilated COVID-19 patients, or
2. Performing **non-AGP** on MV (closed circuit) patients with COVID-19

We **suggest** using surgical/medical masks, as compared to respirator masks, in addition to other personal protective equipment.

Oxygen Targets

Mortality

SPO$_2$

90% 92% 96%
we recommend that SPO₂ be maintained no higher than 96%
Oxygen Targets

we suggest starting supplemental oxygen if the SPO$_2$ < 92\%
Oxygen Targets

we recommend starting oxygen if $\text{SPO}_2 < 90\%$
SPO$_2$ and Mortality

Hypoxemia

- For adults with COVID-19 and acute hypoxemic respiratory failure despite conventional oxygen therapy, we suggest using HFNC over conventional oxygen therapy.
Hypoxemia

• For adults with COVID-19 and acute hypoxemic respiratory failure, we suggest using HFNC over NIPPV.
Hypoxemia

• For adults with COVID-19 and acute hypoxemic respiratory failure, if HFNC is not available and no emergent indication for endotracheal intubation; we suggest a trial of NIPPV with close monitoring and short interval assessment for worsening of respiratory failure.
We were not able to make a recommendation regarding the use of helmet NIPPV compared to mask NIPPV, it is an option, but we are not certain about its safety or efficacy for COVID-19 patients.
Effect of Noninvasive Ventilation Delivered by Helmet vs Face Mask on the Rate of Endotracheal Intubation in Patients With Acute Respiratory Distress Syndrome: A Randomized Clinical Trial

Log-rank P = 0.02

JAMA. 2016 Jun 14;315(22):2435-41
Endotracheal Intubation

- For healthcare workers performing endotracheal intubation on patients with COVID-19, we recommend endotracheal intubation is performed by healthcare worker experienced with airway management, to minimize the number of attempts and risk of transmission.
Endotracheal Intubation

• For healthcare workers performing endotracheal intubation on patients with COVID-19, we suggest using video guided laryngoscopy, over direct laryngoscopy, if available.
**COVID-19 with hypoxia**

**Indication for endotracheal intubation?**

**Tolerating supplemental oxygen?**

- No
  - **Tolerating HFNC**
  - **Not tolerating HFNC** or HFNC is not available
    - **Consider:** ✅ a trial of NIPPV
    - **Do it:** Monitor closely at short intervals
    - **Do not:** Delay intubation if worsening
  - **Consider:** ⚠ HFNC
  - **Do it:** Monitor closely for worsening
  - **Do it:** Target SPO₂ 92 to 96%
  - **Do it:** Appropriate infection control precautions

- Yes
  - Minimize staff in the room
  - **Use N-95/FFP-2 or equivalent and other PPE/infection control precautions**
  - **Expert in airway to intubate**
  - **Do it:** Endotracheal intubation

**Do it:**
- Endotracheal intubation
- Expert in airway to intubate
- Use N-95/FFP-2 or equivalent and other PPE/infection control precautions
- Minimize staff in the room

**Consider:** ⚠ if available

- Video-laryngoscope

**Do not:**
- Delay intubation if worsening
Acute Respiratory Distress Syndrome
We recommend using low Vt (4-8 mL/kg) and Targeting Pplat <30 cmH$_2$O
We **recommend** using low Vt (4-8 mL/kg) and Targeting Pplat <30 cmH$_2$O

We **suggest** using a higher PEEP strategy
We recommend using low Vt (4-8 mL/kg) and Targeting Pplat <30 cmH₂O

we suggest using a higher PEEP strategy

we suggest using a conservative, over a liberal, fluid strategy.

Mod-Severe ARDS
Prone Ventilation

- For mechanically ventilated adults with COVID-19 and moderate to severe ARDS, we suggest prone ventilation for 12 to 16 hours, over no prone ventilation.
Neuromuscular Blocking Agents (NMBA)?
NMBA

• For MV adults with COVID-19 and moderate to severe ARDS, we suggest using as needed intermittent boluses of NMBA, over a continuous NMBA infusion, to facilitate protective lung ventilation.
NMBA

• In case of persistent ventilator dyssynchrony, requirement of ongoing deep sedation, prone ventilation, or persistently high $P_{plt}$; we suggest using a continuous NMBA infusion for up to 48 hours.

Direct Evidence

Retrospective study
N=201
with COVID-19 pneumonia

Corticosteroids

• For mechanically ventilated adults with COVID-19 and ARDS, we suggest using systemic corticosteroids over not using corticosteroids.

• Remark: The majority of our panel support a weak recommendation (i.e. suggestion) to use steroids in the sickest patients with COVID-19 and ARDS. However, because of the very low quality evidence, some experts on the panel preferred not to issue a recommendation until higher quality direct-evidence is available.

---

All observational studies
Corticosteroids

• For mechanically ventilated adults with COVID-19 and respiratory failure (**without ARDS**), we **suggest against** the routine use of systemic corticosteroids
**COVID-19 with mild ARDS**

**Do:**
- Vt 4-8 ml/kg and $P_{\text{plat}} < 30$ cm H$_2$O
- Investigate for bacterial infection
- Target SPO$_2$ 92% - 96%

**CONSIDER:**
- Conservative fluid strategy
- Empiric antibiotics

**Uncertain:**
- Systemic corticosteroids

---

**COVID-19 with Mod to Severe ARDS**

**CONSIDER:**
- Higher PEEP
- NMBA boluses to facilitate ventilation targets
- if PEEP responsive
- Traditional Recruitment maneuvers
- Prone ventilation 12 - 16 h

**CONSIDER:**
- if proning, high $P_{\text{plt}}$, asynchrony
- NMBA infusion for 24 h

**CONSIDER:**
- Prone ventilation 12 - 16 h
- if PEEP responsive
- A trial of inhaled Nitric Oxide
- STOP if no quick response
- follow local criteria for ECMO
- V-V ECMO or referral to ECMO center

**CONSIDER:**
- Short course of systemic corticosteroids

---

**Rescue/Adjunctive therapy**

**CONSIDER:**
- if proning, high $P_{\text{plt}}$, asynchrony
- NMBA infusion for 24 h

**CONSIDER:**
- Prone ventilation 12 - 16 h

**CONSIDER:**
- STOP if no quick response
- A trial of inhaled Nitric Oxide
- follow local criteria for ECMO
- V-V ECMO or referral to ECMO center

**Contraindicated:**
- Staircase Recruitment maneuvers

**CONSIDER:**
- Short course of systemic corticosteroids
Antibiotics

• For mechanically ventilated patients with COVID-19 and respiratory failure, we suggest using empiric antimicrobials/antibacterial agents, compared to no antimicrobials.

• Remark: if the treating team initiates empiric antimicrobials, they should assess for de-escalation daily, and re-evaluate the duration of therapy and spectrum of coverage based on the microbiology results and the patient’s clinical status.
Therapy

For critically ill adults with COVID-19, we *suggest against* the routine use of standard intravenous immunoglobulins.

For critically ill adults with COVID-19, we *suggest against* the routine use of convalescent plasma.

For critically ill adults with COVID-19, we *suggest against* the routine use of lopinavir/ritonavir.
Therapy

• Insufficient evidence to support recommendations for:
  – Antivirals
  – Hydroxychloroquine
  – Immunomodulators
Hemodynamic Support

- For the **acute resuscitation** of adults with **COVID-19 and shock**, we **suggest** using a conservative, over a liberal fluid strategy.

<table>
<thead>
<tr>
<th>Outcomes</th>
<th>No of participants (studies)</th>
<th>Relative effect (95% CI)</th>
<th>Certainty of the evidence</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Serious Adverse Events</td>
<td>637 (9 RCTs)</td>
<td>RR 0.91 (0.78–1.05)</td>
<td>VERY LOW</td>
</tr>
</tbody>
</table>
Hemodynamic Support

• For adults with **COVID-19 and refractory shock**, we **suggest** using low-dose corticosteroid therapy (“shock-reversal”), over no corticosteroid therapy.

• Remark: typical corticosteroid regimen in septic shock is intravenous hydrocortisone 200 mg per day either as an infusion or intermittent doses.

COCA Products & Services

COCA Call

COCA Call Announcements contain all information subscribers need to participate in COCA Calls. COCA Calls are held as needed.

COCA Learn

Monthly newsletter that provides information on CDC training opportunities, conference and training resources, the COCA Partner Spotlight, and the Clinician Corner.

Clinical Action

As-needed messages that provide specific, immediate action clinicians should take. Contains comprehensive CDC guidance so clinicians can easily follow recommended actions.
Coca Products & Services

Monthly newsletter providing updates on emergency preparedness and response topics, emerging public health threat literature, resources for health professionals, and additional information important during public health emergencies and disasters.

Informs clinicians of new CDC resources and guidance related to emergency preparedness and response. This email is sent as soon as possible after CDC publishes new content.

CDC's primary method of sharing information about urgent public health incidents with public information officers; federal, state, territorial, and local public health practitioners; clinicians; and public health laboratories.
Join COCA’s Mailing List

- Receive information about:
  - Upcoming COCA Calls
  - Health Alert Network (HAN) messages
  - CDC emergency response activations
  - Emerging public health threats
  - Emergency preparedness and response conferences and training opportunities
