

Will the COVID-19 Vaccines Affect My Fertility?

No.

“The latest evidence shows that the **COVID-19 vaccines do not cause infertility** or adversely affect sperm count, egg production, or the implantation of embryos. The vaccines give a lasting antibody immunity to COVID-19, a virus that is especially dangerous to pregnant women. They are a major breakthrough of science, and they are going to keep us safe.”

— **Alan Copperman, MD**, Director of Reproductive Endocrinology and Infertility,
Icahn School of Medicine at Mount Sinai
