

A man, paralyzed from the chest down in a terrible accident, using futuristic technology to do incredible things. It's not the latest blockbuster. It's the real story of Robert Woo, a Manhattan architect who was crushed by seven tons of falling steel. His injuries were devastating. But thanks to the Mount Sinai Department of Rehabilitation Medicine, he's walking

again with help from a bionic exoskeleton strapped to his legs. Proof that sometimes, real life is even better than the movies.
