

Fourteen-year-old Liam was a top-ranked player in Israel when diagnosed with a joint condition called osteochondritis dissecans. The pain in his elbow was excruciating, but ending his career would have been even more painful. Unfortunately, if he opted for traditional surgery, that would indeed be his fate. But Liam learned of a more promising option: Mount Sinai would treat his elbow with minimally-invasive surgery that could save his career. Liam flew to New York

for the pioneering procedure, which was a complete success. Today, he's playing his way onto the professional circuit. And he can thank a top-ranked hospital. **For you. For life.**
