

It's a breakthrough in prostate cancer care that will change men's lives forever. And it's called Systems Pathology. Mount Sinai has developed an advanced algorithm that integrates new imaging technologies, genetic data, biomarkers, and the patient's clinical history. It then takes these dissimilar data sets and compares them to hundreds of thousands of other cases in a powerful supercomputer. The result? A more personalized view of the patient's tumor, which enables the surgeons at Mount Sinai's Department of Urology to know just how aggressive or

slow-growing the tumor actually is. Which means doctors and patients can make more informed treatment decisions. Systems Pathology. Another way Mount Sinai is changing the face of medicine...again. **For you. For life.**
