

Brian Lowery was troubled by a persistent dry throat. But a CT scan revealed something more serious: a mass at the base of his tongue. He was immediately referred to the Mount Sinai Head and Neck Institute. The diagnosis was HPV-oral cancer. Doctors performed minimally invasive robotic surgery, a specialty at Mount Sinai, allowing Brian

to return quickly to his daily routine. To make a long story short, Brian is now cancer-free. But if it were up to Brian, he'd tell you every detail.
